

Your next actions

Prepared for Fry | September 23, 2026

Local result: 355 tests passed. The review fixed defects covered by 23 new regression cases. This is not production acceptance.

NOW - INPUT OR ACCESS

- ☐ **1. Locate the '-266' display, if it still appears.**
Send its screenshot or exact command/output. The fresh baseline had no failures; STATE's 266 is a historical passing-test count.
- ☐ **2. Make a browser available for visual testing.**
Connect a browser in this Codex session so desktop and phone-size dashboard, approval, and Resume flows can be checked on screen.
- ☐ **3. Arrange independent Claude / QUENCH review.**
Give the reviewer the local changes and CODE_REVIEW_2026-09-23.md. Codex authored these fixes, so this review does not count as independent.

BEFORE LIVE ROLLOUT - NOT REQUIRED TO KEEP CODING

- ☐ **4. Confirm the service host and hardware availability.**
Confirm where ORCA should run and when ANVIL, FORGE, KILN, EMBER, and IRIS are available for live checks using existing approved access.
- ☐ **5. Confirm safe credential provisioning.**
Provide the approved secret-store reference, never a key in chat or documents. Replace exposed credentials before enabling providers.
- ☐ **6. Confirm restore inputs and physical backup issues.**
Confirm secure coverage for Compose, .env, and /srv/vault. Verify the current status of off-site backup, WD replacement, and UPS concerns carried in STATE; older notes are not a fresh hardware check.
- ☐ **7. Approve the specific release only after acceptance.**
Review the named version, independent findings, live recovery evidence, and rollback steps. No deployment, removal, or cloud-spend action was taken.

What passed. What remains.

Local working tree | agent/orca-rebuild-v1 | September 23, 2026

CHECK	RESULT
Rebuilt control plane + retained legacy tests	355 passed (112 + 243)
New regression cases reproduced, then fixed	23 cases
Python compilation / both JavaScript syntax checks	Passed
Fresh-install / synthetic-state recovery drill	Passed; 112 tests
Rendered browser / independent review / live fleet	Not yet verified

FIXES COMPLETED IN THIS REVIEW

- Approvals and jobs.** Pause/resume preserves approvals and terminal states; read-only ORCA/QUENCH work can finish with a distinct reviewer.
- Secrets and configuration.** Named credential fields redact even arbitrary values; permission, cloud-approval, and cost-cap inputs are stricter.
- Fleet and accounting.** Same-key enrollment retains replay protection; shared SQLite cost/control operations use the same lock.
- Legacy safety and recovery.** LAN binds require configured authentication; cost data is validated; supplied event buses and malformed saved metadata are handled correctly.
- Legacy approval form.** Loopback/Host/route checks, per-prompt CSRF tokens, body limits, and serialized prompt handling protect submissions.

ENGINEERING STILL OWNS THESE ITEMS

- Real bot runners, provider-specific integrations, local-model quality tests, and end-to-end cancellation/error handling.
- Per-identity authentication before remote/multi-user control; reviewed fleet transport, key lifecycle, and live reboot/reconnect testing.
- Live security advisory/provenance checks, actual alerts, stronger external evidence anchoring, and approved-release/secret restoration proof.

Deployment stays off. Connector writes, remote execution, autonomous bot runtimes, and cloud spending remain disabled. The recovery drill used synthetic state; it did not restore production services or secrets.

Evidence in docs/: CODE_REVIEW_2026-09-23.md; RECOVERY_DRILL_2026-09-23.json; STATE_v11_upload.md. Recovery completed 21:12 UTC. Full review contains commands and limitations.
